Ten strategies to pay less tax in retirement

Maximizing your after-tax retirement income

Are you approaching retirement or have you recently retired? Maximizing your retirement income may be an important aspect of enjoying and making the most of this new phase of your life. However, a large portion of your major sources of retirement income may be taxed at the top marginal tax rate with no preferential tax treatment. This is likely to be the case if you depend on sources of retirement income such as employer pensions, Registered Retirement Savings Plans (RRSPs), Registered Retirement Income Funds (RRIFs), Canada/Quebec Pension Plan (CPP/QPP) and interest income.

Fortunately, there are several approaches you may want to consider to maximize your after-tax retirement income. Although not exhaustive, this article discusses ten common tax-saving retirement strategies.

Any reference to a “spouse” in this article also refers to a common-law partner.

The ten strategies

Strategy 1: Spousal RRSPs

Strategy 2: Order of asset withdrawal

Strategy 3: Tax-preferred investment income

Strategy 4: Pension income splitting

Strategy 5: CPP/QPP sharing

Strategy 6: Spousal loan

Strategy 7: Effective use of surplus assets

Strategy 8: Prescribed life annuity

Strategy 9: Tax-Free Savings Account (TFSA)

Strategy 10: Minimum RRIF/LIF/LRIF/PRIF withdrawal planning

If you're already retired, but you still have unused RRSP contribution room and your spouse has not yet reached the year in which they turn 72, you can continue to make spousal RRSP contributions even if you, yourself, are over age 71.

Spousal RRSPs

Canada has a progressive tax system. The progressive nature of the system means that tax rates in Canada increase as your income increases. As a result, you could save significant amounts of tax, annually, if you and your spouse each earn \$50,000 in taxable income as opposed to one of you earning \$100,000, for example. In other words, a spouse with a higher income of \$100,000 may end up paying more tax than if each spouse earned \$50,000. Therefore, equalizing your retirement income may help you achieve significant tax savings year after year.

If you project your retirement income to be higher than that of your spouse, one of the simplest ways to equalize your future retirement income is by making contributions to a spousal RRSP. The sooner you start, the more income you'll be able to shift to your lower-income spouse's spousal RRSP by the time you retire.

If you're already retired, but you still have unused RRSP contribution room and your spouse has not yet reached the year in which they turn 72, you can continue to make spousal RRSP contributions even if you, yourself, are over age 71. Furthermore, it is possible to create additional RRSP contribution room from rental property income or employment income, such as from part-time or consulting work, and contribute to your RRSP up to age 71.

Even with the pension income splitting rules, spousal RRSPs still have benefits. Under the pension income splitting rules, you can only reallocate a maximum of 50% of eligible pension income to your spouse. However, the full value of a spousal RRSP can be taxed in the name of your spouse.

If you and your spouse retire prior

to age 65 and require income above and beyond whatever fixed sources are available (such as government income sources and a company pension), it may be beneficial for the family to be able to draw on a spousal RRSP or spousal RRIF owned by the lower-income spouse. The downside to withdrawing is that you would lose a few years of tax-deferred growth.

Strategy 2 – Order of asset withdrawal

In order to optimize your after-tax retirement income, it's important to determine where to withdraw assets from first to cover any income shortfalls you may have after receiving government and employer pensions. The appropriateness of each withdrawal source will be dependent on your asset types and mix during retirement.

Here, it's important to keep in mind that the tax implications resulting from redeeming different asset types may vary significantly. Generally, if you're in a high tax bracket, it makes sense to withdraw assets that attract the least amount of tax first. If your spouse is in a significantly lower tax bracket, consider withdrawing their taxable assets before yours (and your non-taxable assets before your spouse's).

To help determine the order that may be the most suitable for you to draw assets, consider and use the following asset withdrawal tables as a general reference guide. These are based on the understanding that it's best to use your least-flexible sources of income first. After that, it's generally best to draw down on assets that trigger the least amount of taxation. Please note that this hierarchy is not fixed or set in stone and applicability will vary based on your personal circumstances.

Personal considerations

Asset source	Tax considerations on withdrawal
Locked-in accounts (LIF/LRIF/PRIF) and RRIF — minimums	<ul style="list-style-type: none"> • Minimum payments are taxed as regular income. • Post age 71, minimum withdrawals become a requirement; prior to this, you can choose to keep the plan in a RRSP/LIRA/Locked-in RRSP so that you do not have to receive minimum payments. • Minimums are meant to smooth your cash flow throughout retirement and are a good source for lifestyle expenses, as they must be paid to you and are taxed in the year of receipt.
Taxable distributions from non-registered accounts – Canadian dividend and interest income	<ul style="list-style-type: none"> • These are taxable when the income is earned. • Interest is taxed as regular income and Canadian dividends are subject to lower tax rates. • This income can be a good source to draw from, as you're already paying tax on it regardless; if you are only using the income, you will not be drawing down on your capital, which may preserve future growth.
Tax-Free Savings Account (TFSA)	<ul style="list-style-type: none"> • Any withdrawals from TFSAs are free of tax, which could make it a good tool in the event you have an emergency cash flow need but don't want to increase your taxable income. • The flipside is that by withdrawing from this account, you're losing access to the power of tax-free growth over time if you can't replenish it the following year.
Locked-in accounts and RRIF – above the minimum	<ul style="list-style-type: none"> • If you're in a low tax bracket now and expect to be in a higher one in the future, it may make sense to draw more than the annual minimum • Keep in mind that withdrawals reduce the power of tax-deferred growth.
Tax-favoured income – capital gains	<ul style="list-style-type: none"> • Capital gains are taxed most favourably at the personal level; as such, triggering gains in order to fund lifestyle expenses will allow you to have more after-tax income for spending.
Tax paid capital – principal from non-registered account	<ul style="list-style-type: none"> • Withdrawal of capital may involve disposing of assets which may trigger tax. • Keep in mind that withdrawing capital would reduce the capital available to generate income for the future.

Corporate considerations

Capital dividends from your private corporation	<ul style="list-style-type: none"> • Where there's a positive balance in the capital dividend account (CDA), these types of dividends can be paid out to shareholders tax-free and can be an effective way to fund retirement expenses.
Repayment of shareholder loans owed to you from your private corporation	<ul style="list-style-type: none"> • Like CDA, a repayment of a shareholder loan doesn't trigger any personal tax and can be an effective means to draw funds from your private corporation if personal cash flow is needed.
Dividend payments from your private corporation	<ul style="list-style-type: none"> • These would be taxable to the shareholder when received. • Dividend rates are typically lower than regular income; where you're looking to lower tax, this may be a good alternative.

Because circumstances vary, keep in mind that it's important to discuss the order of withdrawal that's most beneficial for you and your family with a qualified tax advisor.

If you're in a higher tax bracket than your spouse, you may be able to reduce your family's total tax bill by allocating up to 50% of eligible pension income to your spouse. Keep in mind, however, that only certain income is eligible to be split with your spouse.

Strategy 3 — Tax-preferred investment income

Since the preferential tax treatment of Canadian dividends, capital gains and return of capital is lost when earned in and withdrawn from an RRSP/RRIF or locked-in account, the following can be considered when determining your ideal investment allocation with respect to tax characteristics between accounts.

Consider holding your fixed-income or interest-bearing investments, such as bonds and GICs, in your registered accounts (RRSP/RRIF and locked-in) and holding your equity investments, such as common stocks, preferred shares and equity mutual funds, in your non-registered account. Further, foreign dividends are not subject to the preferential tax treatment available to dividends received from Canadian corporations. Instead, this income is taxed as ordinary income, like interest. For this reason, high dividend-paying foreign stocks where capital appreciation is expected to be minimal may be better off held in a registered account.

Again, these are general guidelines only, and depending on your total investable assets, TFSA contribution room and overall asset allocation, following these guidelines may not be feasible. Further, certain investment merits may outweigh any tax advantages. You can use these guidelines as a starting point for analysis.

In a non-registered investment account, Canadian dividends, capital gains and return of capital are taxed at a lower rate than interest income. For this reason, you may be able to maximize your after-tax retirement income by holding equity-based investments that generate Canadian dividends, capital gains or return of capital income in your non-registered account. However, these investments typically carry higher risk than more conservative fixed-income investments and may offer greater returns or losses.

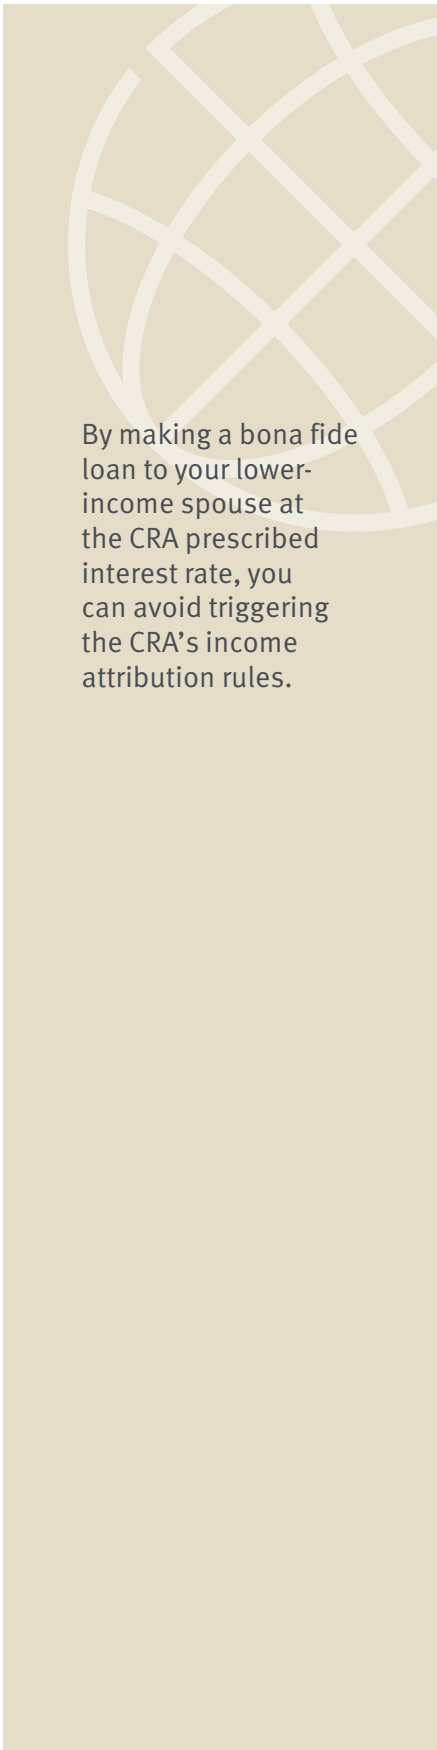

Strategy 4 — Pension income splitting

If you're in a higher tax bracket than your spouse, you may be able to reduce your family's total tax bill by allocating up to 50% of eligible pension income to your spouse. Keep in mind, however, that only certain income is eligible to be split with your spouse. The age of the primary recipient of the income is a factor in determining whether income is eligible for splitting.

The tax savings can occur both federally and provincially where eligible pension income is allocated from a spouse in the higher marginal tax bracket to the spouse in the lower marginal tax bracket. The tax savings depend on a number of factors, including the amount of eligible pension income available to be split with your spouse, the difference in your marginal tax rates and the impact that the reallocation could have on certain government benefits and tax credits. For example, if you're subject to the OAS clawback, splitting your eligible pension income with your lower-income spouse will reduce your net income, which may in turn reduce or eliminate your clawback.

If you're under 65 years of age during the entire tax year, you'll generally be able to split only the income that's paid to you directly from a defined benefit pension plan. Alternatively, if you're at least 65 years of age during the tax year, there are more types of income considered eligible to be split with your spouse, including RRIF/LIF/LRIF/PRIF income. Please note that RRSP withdrawals and CPP/QPP and OAS are not considered eligible pension income for income splitting purposes.

The decision of how much income to split, if any, is made when you prepare your income tax returns for the year in which the income was received. Remember that pension income splitting does not involve actually transferring the money to your spouse. You're only splitting the income on

By making a bona fide loan to your lower-income spouse at the CRA prescribed interest rate, you can avoid triggering the CRA's income attribution rules.

your tax return by completing a joint election with your spouse.

Strategy 5 — CPP/QPP sharing

Although the CPP/QPP pension is not considered eligible pension income for the purpose of pension income splitting (described in Strategy 4), you may achieve tax savings by sharing your CPP/QPP with your lower-income spouse. This may be a particularly viable strategy if you have a spouse with a limited working history and thus made limited contributions to the CPP/QPP. This may lower your family tax bill and help to increase your age credit, as well as reduce OAS clawback where applicable.

Since both spouse's CPP/QPP retirement pension must be shared, sharing generally doesn't make sense if you have a lower CPP/QPP entitlement than that of your lower-income spouse during the time you've lived together (see below for further explanation of the calculation process). This will result in additional pension income being taxed at your higher marginal tax rate.

To be eligible for sharing your CPP/QPP with your spouse, keep in mind that you must fulfill certain conditions. A main one among these is that your spouse must be at least 60 years of age and receiving CPP/QPP pension benefits (unless they never contributed to CPP/QPP).

The pension sharing calculation process involves combining the CPP/QPP pension entitlement you and your spouse earned during the time you lived together (either as married/civil union or common-law/de facto spouses) and then allocating 50% of the combined total to each of you. Any individual entitlements you and your spouse earned prior to the time you lived together cannot be shared. Although pension sharing can reallocate up to 50% of your CPP/QPP pension to your spouse, it will not increase or decrease the overall

combined pension benefit paid.

Strategy 6 — Spousal loan

Generally, you achieve no tax advantage when you simply give funds to your lower-income spouse to invest — this is because of “attribution”. The Canada Revenue Agency (CRA) attributes any investment income earned on these gifted funds back to you, as if you had earned it yourself. This is where the spousal loan strategy may help you reduce your taxes payable.

By making a bona fide loan to your lower-income spouse at the CRA prescribed interest rate, you can avoid triggering the CRA's income attribution rules. Your spouse must make the annual interest payments. The prescribed rate in effect at the time your loan is established remains in effect for the lifetime of the loan. Your spouse can then invest the loan proceeds, and the investment income and capital gains earned will be taxed at your spouse's lower rate.

The benefit of this strategy comes down to the difference between the prescribed rate and the investment return. The lower the prescribed rate relative to the return on investments, the greater the opportunity to benefit from this strategy and have income taxed in your lower-income spouse's hands. Other factors that may impact the degree of tax savings you can potentially reap from this strategy include the types of investments (i.e. investment asset mix) your spouse purchases with the loan proceeds and the difference between your tax rate and your spouse's tax rate. For more information, please ask an RBC advisor for our article on spousal loans.

Strategy 7 — Effective use of surplus assets

With a growing senior population in Canada and generally longer life expectancies, many Canadians may be facing potentially escalating healthcare and long-term care costs. With this

With a growing senior population in Canada and generally longer life expectancies, many Canadians may be facing potentially escalating healthcare and long-term care costs.

in mind, it's imperative that you're prepared for these contingencies before redirecting your surplus assets. Preparing a financial plan may help you determine your cash flow needs and identify any surplus assets.

If your financial plan determines that you have surplus non-registered assets that you'll likely not need during your lifetime, even under very conservative assumptions, then consider directing these excess assets to other more effective uses. Below are three options which may be of interest.

Tax-exempt life insurance

If you are planning to leave some of your assets to your heirs upon your death and you will definitely not need to use these assets during your lifetime, you may be paying high amounts of tax on the income generated on these assets. If this is the case, consider directing these highly taxed assets towards a tax-exempt life insurance policy, where the investment income can grow on a tax-free. This way, the amount that would have been payable to the CRA on these surplus assets during your lifetime could instead be paid directly to your beneficiaries in the form of a tax-free death benefit. The death benefit can also be used to create a family trust or a charitable legacy. Speak with a licensed life insurance representative to see if insurance makes sense for you.

Lifetime gifts

If you have surplus assets that you won't need during retirement and you know you'll be providing funds to your adult lower-income children or grandchildren in the future. You may wish to assist them with buying a home, education costs, starting a business or paying for their wedding. If this is the case, it may not make sense to continue exposing the income from these surplus assets to your higher marginal tax rate. Instead, consider gifting some of these surplus funds now as an outright cash lump-

sum gift. Before pursuing this option, keep in mind that gifting in this way means you'll no longer have control of these assets.

Establish a family trust for adult children or grandchildren beneficiaries

If you don't want to give your adult children or grandchildren control over your surplus funds, you may want to consider using the funds to establish a family trust. You can direct your surplus funds to the family trust through either a gift (irrevocable) or a demand loan (revocable). Your children and/or grandchildren beneficiaries can be beneficiaries of the trust. If structured correctly, the family trust can allow you to allocate income to your children or grandchildren and ensure that it's taxed in their hands at their lower marginal tax rate. Be sure to speak with a qualified tax and legal advisor to ensure that your trust is properly structured and meets your needs.

Strategy 8 — Prescribed life annuity

If you're retired, a conservative investor and not satisfied with your fully taxable cash flow from traditional non-registered fixed-income assets (e.g. GICs and government bonds), consider using some of these fixed-income assets to purchase a prescribed life annuity. The prescribed life annuity will provide a guaranteed income stream for your lifetime with the advantage of partial tax deferral.

If you're concerned that your annuity will not provide any payout to your beneficiaries upon your death, an insured annuity may be an option. With an insured annuity, part of your annuity payment is used to pay the premiums on a life insurance policy to ensure that a death benefit is paid to your beneficiaries. You may also consider an annuity with survivorship for your spouse or a guaranteed payment term (e.g. 5

Although TFSA contributions are not tax-deductible, remember that the income and gains generated in the TFSA grow tax-free. Additionally, any money withdrawn from a TFSA is not taxable.

years, 10 years) that will pay the residual to your estate. Speak with a licensed life insurance representative to determine if a prescribed annuity makes sense in your circumstances.

Strategy 9 – Tax-Free Savings Account (TFSA)

In retirement, you continue to be able to contribute money to a TFSA, up to your contribution limit. Although TFSA contributions are not tax-deductible, remember that the income and gains generated in the TFSA grow tax-free. Additionally, any money withdrawn from a TFSA is not taxable.

To the extent you have excess cash flow, contributing to your TFSA annually will help you to maximize your tax-free growth. Further, TFSA withdrawals have no impact on income-tested benefits like OAS, nor do they limit entitlement to other government plans like the guaranteed income supplement and the age credit.

Strategy 10 – Minimum RRIF/LIF/LRIF/PRIF withdrawal planning

If your pension income and non-registered assets sufficiently meet most of your retirement expenses, then you'll likely need to withdraw only the mandatory minimum amount from your RRIF or from your locked-in plans each year.

Below are some strategies to maximize the tax-deferral within your RRIF/LIF/LRIF/PRIF in order to maximize your after-tax retirement income:

- If your spouse is younger than you, you may be able to base your minimum annual RRIF/LIF/LRIF/PRIF withdrawal on your spouse's age in order to minimize the amount of the annual withdrawal, thereby keeping more assets in the registered environment to grow on a tax-deferred basis. Many of the provinces and territories have locked-in plan legislation (LIF/LRIF/PRIF) that permits you to base your mandatory minimum payment on your spouse's age.
- Convert your RRSP/LIRA/Locked-in RRSP to a RRIF/LIF/LRIF/PRIF as required by the end of the year in which you turn age 71, but don't make your first withdrawal until the end of the year in which you turn age 72; this may allow for increased tax-deferred growth.

Withdraw the annual required minimum from your RRIF/LIF/LRIF/PRIF as a lump-sum at the end of each year. This may allow for more tax-deferred growth on your minimum payment.

Summary

Although the majority of retirement income sources are taxed at a high rate with no preferential tax treatment, there are some common strategies that may help you to maximize your after-tax income in retirement. Speak with a qualified tax advisor to see if any of the strategies discussed in this article can help you.
